Proposal to create a Drupal 8 User Manual

[View](#) [Revisions](#)

Posted by [jhodgdon](#) on June 2, 2015 at 4:08pm

 17 Every time someone does a survey of "What does the Drupal project need?", Documentation comes out as one of the top results, even though we have a large amount of [Community Documentation](#) and a comprehensive [developer reference](#) with topic pages. One key problem is that for Drupal newcomers, the sheer amount of documentation is overwhelming, and what we have is somewhat lacking in organization, so they don't know where to start in order to learn how to use Drupal.

To mitigate this problem, the [Documentation Working Group](#) is proposing to create a new Drupal 8 User Guide, with funding (hopefully) from a Community Cultivation Grant from the Drupal Association.

We're posting the entire proposal below.... We'd love to hear from you between now and June 19, at which point we'll apply for grant funding. Please let us know:

- What do you think of the idea?
- Do you have any suggestions?
- Are you interested in being part of the team that develops the initial manual?

Note: June 19 has passed, and this post is now closed to comments. Thanks for all of the suggestions and offers to help! We'll be in touch!

This post contains a follow up to the proposal here as well as some information about how we're planning to proceed with this project based on all the excellent feedback we received: <https://groups.drupal.org/node/472728>

If you are interested in being part of the initial team, we have a few more questions for you, which you can either answer here or send privately to me or to any member of the [Documentation Working Group](#):

- How much time do you have (July-September 2015)?
- Would you need funding, or will your employer sponsor at least part of your time?
- Are you interested in participating as a writer or editor (see proposal)?
- Can you provide a technical writing sample? (such as a link to a Drupal.org page that you wrote or extensively revised, or a technical blog post you wrote)

Here is the summary of the proposal; the complete text is attached as a PDF document:

 The Drupal 8 User Manual provides quality documentation in multiple languages, aimed at helping "Newcomers" or "Learners" to become "Skilled" site builders or site administrators. It is a concise guide to building and administering a typical Drupal site. Therefore, it does not cover everything in Core, but also is not limited to Core modules and references contributed tools like Drush. The manual is written in AsciiDoc: a popular open-source, GPL-licensed, plain-text-with-markdown format. It can be displayed on *.drupal.org or within a Drupal 8 site,

Understanding Drupal" with a section heading "1.1. Concept: Drupal as a Content Management System".

Chapter 1. Understanding Drupal

1.1. Concept: Drupal as a Content Management System

What is a Content Management System?

A content management system (CMS) is a software tool that lets users add, publish, edit, or remove content from a website, using a web browser on a smartphone, tablet, or desktop computer. Typically, the CMS software is written in a scripting language, and its scripts run on a computer where a database and a web server are installed. The content and settings for the website are usually stored in a database, and for each page request that comes to the web server, the scripts combine information from the database and assets (JavaScript files, CSS files, image files, etc. that are part of the CMS or have been uploaded) to build the pages of the website.

The combination of the operating system that the CMS runs on, the scripting language it is written in, the database it stores its information in, and the web server that runs the scripts to retrieve information and return it to the site visitor's web browser is known as the *stack* that the CMS runs on; the commonly used combination of the Linux operating system, Apache web server, MySQL database, and PHP scripting language is known as the *LAMP stack*.

What is Drupal?

Drupal is a flexible CMS based on the LAMP stack, with a modular design allowing features to be added and removed by installing and uninstalling *modules*, and allowing the entire look and feel of the website to be changed by installing and uninstalling *themes*. The base Drupal download, known as Drupal Core, contains the PHP scripts needed to run the basic CMS functionality, several optional modules and themes, and many JavaScript, CSS, and image assets. Many additional modules and themes can be downloaded from the [Drupal.org](#) website.

Drupal can also run on other technology stacks:

- The operating system can be Windows or Mac OS instead of Linux.
- The web server can be Nginx or IIS instead of Apache.

The header features a logo with a sun and a house, the text "Anytown Farmers Market Farm Fresh Food", and a navigation menu with "Home", "About", and "Vendors". The "Vendors" menu item is highlighted. The main content area has a title "Vendors" and displays two vendor entries: "Happy Farm" and "Sweet Honey". Each entry includes a small image, the vendor name, and a brief description. To the left of the main content is a sidebar with "Tools" and "Add content" buttons. On the right, there's a sidebar with "Hours and location" information: "Open: Sundays, 9 AM to 2 PM, April to September" and "Location: Parking lot of Trust Bank, 1st & Union, downtown". At the bottom, there's a section titled "Expand your understanding" with a note about changing navigation order and attribution information for Boris Doesborg and Jennifer Hodgdon.

The address bar indicates the URL is https://2017.drupalcamp-frankfurt.de/sites/default/files/session_slides/guide-en.pdf. The page content is a PDF document titled "12.1. Concept: Cache". It includes sections on "Prerequisite knowledge" (linking to "Section 1.1, 'Concept: Drupal as a Content Management System'"), "What is the page cache?", and "What other data is cached?". The text discusses how page load time can be sped up by using caching modules like Internal Page Cache and Dynamic Page Cache, which store intermediate results in a database area called the cache. It also lists common problems with page cache, such as corrupted data, outdated data, and slow page loads. The PDF content is presented in a white box with black text, set against a dark background.

12.1. Concept: Cache

Prerequisite knowledge

[Section 1.1, "Concept: Drupal as a Content Management System"](#)

What is the page cache?

The software that runs your site, on each page request, must perform calculations and retrieve data from the database, in order to compose the page that is sent to the web browser or other application that is accessing the site. These calculations take time, which can mean that your page load time is longer than would be desirable.

There are several ways that page load time can be sped up, including installing software on the server. The system includes the core Internal Page Cache and Dynamic Page Cache modules, which do not require any additional server software; they use a *database cache* mechanism to speed up your site. The way these modules work is that during page calculations, intermediate results and the final page output are stored in a special database area (known as the *cache*). Then the next time a compatible request is made, intermediate or final results, as appropriate, can be retrieved and used rather than redoing the entire calculation. In addition, when content or data that affects a particular calculation is updated, the affected cached data is removed from the cache, forcing that part of the calculation to be redone the next time it is needed.

These caching modules normally work reasonably well, and offer at least some speed-up for most sites. However, sometimes the page cache can have problems, such as:

- Corrupted data in the cache, leading to garbled or incorrect page output
- Old data remaining in the cache too long, leading to outdated page output
- Insufficient caching, leading to slow page loads

What other data is cached?

Independent of whether the two page cache modules are installed on your site, the software that runs your site will still cache the output of many internal calculations. The core systems that cache

13.3. Concept: Security and Regular Updates

Prerequisite knowledge

- [Section 1.1, "Concept: Drupal as a Content Management System"](#)
- [Section 1.2, "Concept: Modules"](#)
- [Section 1.3, "Concept: Themes"](#)
- [Section 1.6, "Concept: The Drupal Project"](#)

What are security updates?

Any software occasionally has bugs, and sometimes these bugs have security implications. When security bugs are fixed in the core software, modules, or themes that your site uses, they are released in a *security update*. You will need to apply security updates in order to keep your site secure. See [Section 13.4, "Keeping Track of Updates"](#) to learn how to be notified of security updates by email, and [Section 13.5, "Updating the Core Software"](#), [Section 13.6, "Updating a Module"](#), and [Section 13.7, "Updating a Theme"](#) to learn how to make updates.

What is the security team?

The Drupal open-source project has a team of volunteers who track security-related bugs and release security updates. They also help other developers fix bugs, and maintain information for users on how to keep their websites secure. You can learn more about the security team and their practices and processes at the [Drupal.org Security Team](#) page.

How are security bugs reported?

It is important that security problems be kept confidential until they are fixed, so that sites are less likely to be compromised before they can be secured. If you find a potential security problem in any of the software you downloaded from the [Drupal.org](#) website, follow the procedures on the [Drupal.org Security Team](#) page to report it.

What are regular (non-security) updates?

The core software, modules, and themes also periodically have regular updates to add new fea-

A screenshot of a web browser window displaying the "Drupal 8 User Guide" glossary page. The browser has a dark theme. The title bar shows two tabs: "talk-drupal-8-user-g" and "Drupal 8 User Guide". The address bar indicates a secure connection to https://2017.drupalcamp-frankfurt.de/sites/default/files/session_slides/guide-en.pdf. The main content area features a large, bold heading "Glossary". Below it, a list of terms is presented with their definitions:

- Ajax**
A web technology used to exchange data with a server to dynamically update parts of a web page (for example, forms) without needing entire page reloads.
- Alias**
A user-friendly name to replace the internal [path](#) that the system assigns to a URL on the site. For example, you might assign an alias of [/about](#) to the About page on your site, to replace the internal path [/node/5](#). This would give the page a URL of <http://example.com/about> instead of <http://example.com/node/5>. See [Section 5.1, "Concept: Paths, Aliases, and URLs"](#) for more information.
- Anonymous**
A person ([user](#)) interacting with the site who is not logged in. See [Section 7.1, "Concept: Users, Roles, and Permissions"](#) for more information.
- Block**
A chunk of [content](#) (text, images, links, etc.) that can be displayed on a page of a site. Blocks are displayed in [regions](#). See [Section 8.1, "Concept: Blocks"](#) for more information.
- Breakpoint**
Breakpoints are used to separate the height or width of browser screens, printers, and other media output types into steps. A [responsive](#) site adjusts its presentation at these breakpoints. See [Section 6.14, "Concept: Responsive Image Styles"](#) for more information.
- Bundle**
Synonym for [Entity subtype](#).
- Cache**
The site's internal cache stores the output of time-consuming calculations, such as computing output for an HTML page request, and then retrieves them instead of recalculating the next time they are needed. External caching systems can also be used on the web server to speed up a site's response. See [Section 12.1, "Concept: Cache"](#) for more information on the internal

Ezzel a nélkülözhetetlen alkalmazással lentebb még bővebben is foglalkozunk.

Git

A Git egy verziókövető rendszer, amivel akár csak modulok és sminkek saját könyvtárait, akár a webhely teljes kódbazisát felügyelhetjük: hol, mikor, milyen változtatás történt. A Git nyilvántartására támaszkodva biztonságosabban próbálhatunk ki módosításokat, mert ha egy változtatás nem sikeres, könnyen vissza tudunk állni az utolsó, még működőképes állapotra. Mivel a Drupal fájlokban is tárolja a konfigurációját, ezért a Git segítségével összehasonlíthatjuk és hordozhatjuk a beállításokat két webhelymásolat (például a helyi gépen futó és az élesítésre váró) között. Napjainkra a Git a nemzetközi webfejlesztési iparág *de facto* szabványává vált.

Erről a másik nagyszerű segítségről is írunk még alább.

This project houses the source files for the Drupal User Guide. It is not a module. The Guide was written in English, and has been partially translated into at least 10 other languages.

You can view the User Guide online (HTML version, in English with links to other languages in the sidebar), or download PDF and other e-book versions. See the [Links section on this page](#) for more information and other options.

Status

The User Guide project was started during the Drupal 8 development cycle by the [Documentation Working Group](#) (DocWG), as a community initiative. Members of the community write, edit, and translate the guide, using templates and following guidelines provided by the DocWG.

The User Guide is now completely written and edited in English. It is also being translated into at least 10 languages, and you can see the in-progress translations of the Guide via links on the Guide pages.
